#### Kinematic planning and dynamic control for bipeds

#### Albert Mukovskiy<sup>1</sup>, Martin A. Giese <sup>1</sup>

<sup>1</sup>Section Computational Sensomotorics, Hertie Institute for Clinical Brain Research & Center for Integrative Neuroscience, University of Tübingen, Germany

#### July 16, 2014

#### Motivation

- We propose the architecture capable for the online synthesis of kinematic trajectories of the whole body movements
- We propose an approach for low level control for the bipedal walk, driven by kinematic reference trajectories

• = • • = •

## Natural looking movements and reactive behavior in real-time

#### Anechoic mixture model

- Learning of movement primitives from motion capture data [Gleicher, 1989; Bodenheimer & Rose, 1997; Arikan et al., 2003; Safanova et al., 2004; Boulić et al. 2005; Shapiro et al, 2004].
- Trajectories approximated by anechoic mixture model:

[Omlor & Giese, Neurocomputing, 2007; NIPS, 2006]

3 🕨 🖌 3

#### Kinematic primitives [Giese et al., 2009; Mukovskiy et al., 2008]

- Source signals generated online by dynamical systems (dynamic primitives). [e.g.: Ijspeert, Nakanishi, Schaal, 2002.]
- Mapping of the solutions of the dynamic primitives onto source signals by support vector regression.

#### Online motion synthesis

The interpolation between two movement styles (a) and (b), e.g. neutral and emotional walking, can be characterized by the equations

$$m_{i}(t) = \lambda(t) m_{i}^{a} + (1 - \lambda(t)) m_{i}^{b}$$

$$w_{ij}\left(t
ight)=\lambda\left(t
ight)w_{ij}^{a}+\left(1-\lambda\left(t
ight)
ight)w_{ij}^{b}$$

 $\lambda(t)$  specifies the movement style.

The temporal change of the heading direction  $\varphi_i$  of the character *i*):

$$\frac{d\varphi_{i}}{dt} = \underbrace{h_{\text{goal}}^{\text{goal}}(\varphi_{i}, \mathbf{p}_{i}, \mathbf{p}_{i}^{\text{goal}})}_{\text{goal-finding term}} + \underbrace{\sum_{j} h^{\text{avoid}}(\varphi_{i}, \mathbf{p}_{i}, \mathbf{p}_{j})}_{\text{instantaneous obstacle avoidance}} + \underbrace{\sum_{j} h^{\text{pcoll}}(\varphi_{i}, \varphi_{j}, \mathbf{p}_{i}, \mathbf{p}_{j})}_{\text{predictive obstacle avoidance}}$$

#### Online motion synthesis

### Control of step frequency and step phase:

$$\dot{oldsymbol{\phi}}=\omega_0\mathbf{1}{-}m_d(\mathbf{L}^d\,G(\phi{+}\phi^0){+}\mathbf{c}){-}k\mathbf{L}^\phi\phi$$

Control of step length:

$$\dot{\mathsf{z}} = \omega g(\phi + \phi^0)(1 - m_z(\mathsf{L}^z \mathsf{z} + \mathbf{c}))$$

 $\phi_i$ ,  $z_i$  - gait phases and positions of characters,  $\dot{z}_i(t) = \dot{\phi}_i g(\phi_i)$ ,  $G(\phi_i) = \int_0^{\phi_i} g(\phi) d\phi$ .

**Contraction theory** provides the proof of exponential stability of such hierarchically coupled system.

[Giese et al., 2009; Mukovskiy et al., 2010, 2011, 2012]

#### Goal directed movements

**Problem:** Excessive number of DoFs allows redundancy in the joints angle space during reaching with the same final configuration of end-effector.

Not style-preserving

**Solution:** We learn the augmented style-goal space with dimensionality reduction technique. We use LWLR to learn the mapping from this space onto  $\mathbf{W}$ .

Mukovskiy, Giese (Univ. of Tübingen) Kinematic planning and dynamic control for

Style-preserving

Kinematic primitives

### Reaching-grasping during walking

The two examples of controlled experiments of goal grasping during walking. The goal relative timing in respect to the gait-phase and its position are controlled by VR setup.

The shift-invariant sources for single step walking-and-grasping. The bump-like source is black dotted line.

- 3 periodic signals contribute to the all body angles with fixed delays.
- Non-periodic signal (bump-like source) has variable delays.

### Reaching-grasping during walking

Autonomously controlled grasping of targets at different positions and timings.

Reaching-grasping for moving targets.

#### Kinematic primitives

#### Draw-opening task (with W.Land, T.Schack, Uni. Bielefeld)

**Data set**: 3-step sequences:

- 1) normal walking step;
- 2) step with the reaching towards the drawer handle;
- 3) drawer-opening and object grasping.

#### Draw-opening task: autonomous controller

#### Synthesis:

- the steps lengths are inferred for default target distance

- for the step 1, the weights depend on this step size only

– for steps 2 and 3 the weights depend on the step length of step 2 and timing of steps  $2\!+\!3$ 

#### Draw-opening task

Online perturbation scenario.

Autonomous repetition of Step 1 or/and Step 2 if goal is too far away.

Sad walk

Happy walk

Mukovskiy, Giese (Univ. of Tübingen) Kinematic planning and dynamic control for

#### Summary

- Flexible realtime synthesis of the kinematics of complex behaviors based on dynamical systems architecture
- Event-based switching force controller based on equilibrium-point control to generate stable basic walk
- The force control can be combined with the kinematic level control for the realization of the stable gaits with different styles

#### Outlook:

- Implementation of more efficient switching impedance parameters, learned by applying optimization methods.
- Increasing robustness.
